# Deterministic control above the model

**The model is called into the authorization path.**
**It never owns a transition.**

## A AUTHORIZATION PATH

## B SEPARATE WRITE AUTHORITIES

**Models may propose. Only the named authority can establish project truth.**

| Project fact ledger | Evidence vault | Decision ledger | Artifact repository | Audit ledger |
|---|---|---|---|---|
| Authorized user confirms | Workers read only | Append only | Immutable revisions | Tamper-evident trail |

## C CAPABILITY REMOVED FROM THE MODEL'S REACH

- × **No patient-data connector or query interface**
- × **No production secret or credential**
- × **No route to a live federation**
- × **No model write, runtime control, or deployment authority**

**Capability removal, not prompt obedience, defines the safety boundary.**
